Office Action Summary

Application No.

10/814,700

Applicant(s)

HART ET AL.

Examiner

James A. Thompson

Art Unit

2624

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 30 March 2004 and 27 December 2004.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-112 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-112 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 30 March 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claim 81 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 81 recites the limitation "method of claim 1" in line 1. There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -
(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 78, 92 and 112 are rejected under 35 U.S.C. 102(b) as being anticipated by Sugiyama (US Patent 5,633,723).

Regarding claim 78: Sugiyama discloses receiving time-based media data from a media source (column 3, lines 12-17 of Sugiyama); receiving user input (column 3, lines 41-50 of Sugiyama), the user input specifying a multimedia function to perform on the time-based media data (column 3, lines 57-63 of Sugiyama); performing the specified multimedia function on the

Art Unit: 2624

time-based media data (column 3, lines 57-63 of Sugiyama) to obtain an electronic image data (figure 4 and column 4, lines 30-35 of Sugiyama) and associated print data (column 4, lines 35-42 of Sugiyama); producing output on a printer from the associated print data from the processor (column 4, lines 35-42 of Sugiyama); and producing an electronic output from the electronic image (column 4, lines 30-35 of Sugiyama).

Regarding claim 92: Sugiyama discloses selecting a range of video data in response to received input from the user (column 3, lines 45-48 of Sugiyama).

Regarding claim 112: Sugiyama discloses that the multimedia function includes applying a visual inspection function to the time-based media data (column 5, lines 56-65 of Sugiyama).

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

6. Claims 1-4, 7-8, 15-16, 18-23, 35, 42-43, 50, 62, 74, 79-81, 84-85, 93 and 95-100 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888).

Regarding claim 1: Sugiyama discloses a printer (figure 1 of Sugiyama) for printing (column 6, lines 19-26 of Sugiyama) time-based media data (column 3, lines 12-17 of Sugiyama), the

Art Unit: 2624

printer comprising a communication interface (figure 1(11) of Sugiyama) for receiving time-based media data from a media source (column 3, lines 12-17 of Sugiyama); a processor (figure 1(15) of Sugiyama) for performing a multimedia function on the time-based media data (column 3, lines 57-63 of Sugiyama) to obtain an electronic image (figure 4 and column 4, lines 30-35 of Sugiyama) and associated print data (column 4, lines 35-42 of Sugiyama); and a user interface (figure 1(20-25) of Sugiyama), communicatively coupled to the processor (column 3, lines 41-44 of Sugiyama), including a display (figure 1(20) of Sugiyama) for providing data to the user (column 3, lines 45-50 of Sugiyama) and an input device (figure 1(21-25) of Sugiyama) for receiving data from the user (column 3, lines 41-50 of Sugiyama). The collection of input keys (figure 1(21-25) of Sugiyama), along with the display (figure 1(20) of Sugiyama) which responds according to the inputs given by the collection of input keys (column 3, lines 41-50 of Sugiyama), forms the overall user interface.

Sugiyama further discloses a first output device (figure 1 (32-33) and column 7, lines 48-53 of Sugiyama) for receiving the associated print data from the processor and producing output on a printer (column 4, lines 35-42 of Sugiyama); and a second output device (figure 1(20) of Sugiyama) coupled to the processor for receiving the electronic image and producing an electronic output from the image (column 4, lines 30-35 of Sugiyama). The head driver (figure 1(32) of Sugiyama) and thermal head (figure 1(33) of Sugiyama) together comprise the overall output printing device (column 7, lines 48-53 of Sugiyama), which produces a printed output of the resultant video image data (column 4, lines 35-42 of Sugiyama). As can be

Art Unit: 2624

seen in figure 1 of Sugiyama, the display is coupled to the processor through the monitor driver (figure 1(19) of Sugiyama), digital-to-analog converter (figure 1(18) of Sugiyama), and selector (figure 1(17) of Sugiyama).

Sugiyama does not disclose expressly that the display of said user interface is a separate component from the second output device.

Chino discloses a user interface (figure 12(305a,306a) of Chino) for user input that includes a display (figure 4 and column 7, lines 48-54 of Chino) that is separate (column 15, lines 45-50 of Chino) from the other output devices (figure 12(308a) and column 15, lines 53-54 of Chino). There are several different devices and types of devices used for producing an output of the resultant multimedia data (column 15, lines 53-54 of Chino). The display through which the user interacts with the overall system (figure 4 of Chino) is separate from the output devices (column 7, lines 48-54 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely multimedia image data processing and control. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to have a separate user interface for the user, as taught by Chino. The motivation for doing so would have been to allow the user to smoothly communicate with the system (column 7, lines 58-64 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claim 1.

Regarding claims 2 and 79: Sugiyama does not disclose expressly that said multimedia function includes selecting a range of audio data in response to received input from the user.

Art Unit: 2624

Chino discloses selecting a range of audio data in response to received input from the user (column 14, lines 8-18 of Chino). Only the audio data that is intended to be input by the user is input in response to the appropriate user input, while any other noise is ignored by the system (column 14, lines 8-18 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to allow the user to input only a specifically desired range of audio data, as taught by Chino. The motivation for doing so would have been to prevent unintended and erroneous audio input (column 14, lines 10-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 2 and 79.

Regarding claims 3 and 80: Sugiyama does not disclose expressly that said multimedia function includes applying audio event detection to the time-based media data.

Chino discloses applying audio event detection to the time-based media data (column 14, lines 8-18 of Chino). The system detects when audio data is intended to be input by the user, while any other noise is ignored by the system (column 14, lines 8-18 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to detect audio data events, as taught by Chino. The motivation for doing so would have been to prevent unintended and erroneous

Art Unit: 2624

audio input (column 14, lines 10-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 3 and 80.

Regarding claims 4 and 81: Sugiyama does not disclose expressly that the multimedia function includes determining a confidence level associated with the audio event detection.

Chino discloses that an audio event is detected (column 14, lines 8-11 of Chino) based on specific criteria that are to be met to the satisfaction of a computer automated system (column 14, lines 11-19 of Chino). Thus, a confidence level associated with the audio event detection is determined.

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to detect audio data events based on a determined confidence level, as taught by Chino. The motivation for doing so would have been to prevent unintended and erroneous audio input (column 14, lines 10-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 4 and 81.

Regarding claims 7 and 84: Sugiyama does not disclose expressly that said multimedia function includes applying a sound source localization function to the time-based media data.

Chino discloses applying a sound source localization function to time-based media data (column 13, lines 5-14 of Chino). By using the gaze object detection portion of the multi-modal interface apparatus, the audio sound source localization is determined.

Art Unit: 2624

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to configure the user interface to apply a sound source localization function to the time-based media data, as taught by Chino. The motivation for doing so would have been to ensure that user input is intended, and the user is not speaking to someone else (column 1, lines 52-58 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 7 and 84.

Regarding claims 8 and 85: Sugiyama does not disclose expressly that said multimedia function includes applying audio event detection to the time-based media data.

Chino discloses applying audio event detection to the time-based media data (column 14, lines 8-18 of Chino). The system detects when audio data is intended to be input by the user, while any other noise is ignored by the system (column 14, lines 8-18 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to detect audio data events, as taught by Chino. The motivation for doing so would have been to prevent unintended and erroneous audio input (column 14, lines 10-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 8 and 85.

Art Unit: 2624

Regarding claim 15: Sugiyama discloses selecting a range of video data in response to received input from the user (column 3, lines 45-48 of Sugiyama).

Regarding claims 16 and 93: Sugiyama does not disclose expressly that said multimedia function includes applying a video event detection function to the time-based media data.

Chino discloses applying a video event detection function to the time-based media data (column 7, lines 33-40 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to configure the user interface to apply a video event detection function to the time-based media data, as taught by Chino. The motivation for doing so would have been to be able to apply user gestures as another form of data input (column 7, lines 38-45 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 16 and 93.

Regarding claims 18 and 95: Sugiyama does not disclose expressly that said multimedia function includes applying a face detection function to the time-based media data.

Chino discloses applying a face detection function to time-based media data (figure 20(406) and column 24, lines 25-27 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a face detection function to time-based media data, as

Art Unit: 2624

taught by Chino. The motivation for doing so would have been to determine which particular user corresponds to the current user by recognition of the current user's face (column 26, lines 20-22 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 18 and 95.

Further regarding claims 19 and 96: Chino discloses applying a clustering function to the time-based media data to merge multiple instances of a face into a representative image (column 26, lines 1-12 of Chino).

Regarding claims 20 and 97: Sugiyama does not disclose expressly that said multimedia function includes applying a face recognition function to the time-based media data.

Chino discloses applying a face recognition function to time-based media data (figure 20(406) and column 24, lines 25-27 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a face recognition function to time-based media data, as taught by Chino. The motivation for doing so would have been to determine which particular user corresponds to the current user by recognition of the current user's face (column 26, lines 20-22 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 20 and 97.

Regarding claims 21 and 98: Sugiyama does not disclose expressly that the multimedia function includes applying an

Art Unit: 2624

optical character recognition function to the time-based media data.

Chino discloses applying an optical character recognition function to time-based media data (figure 3(102j) and column 7, lines 14-18 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply an optical character recognition function to time-based media data, as taught by Chino. The suggestion for doing so would have been that character recognition from an electronic pen is simply another useful electronic means to input data into a computerized system (figure 3 and column 7, lines 2-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 21 and 98.

Further regarding claims 22 and 99: Chino discloses applying a clustering function to the time-based media data to merge similar results of the optical character recognition (column 7, lines 15-21 of Chino). The particular language input by the user, such as German, Russian and Chinese, which use different character sets, is detected. The particular language determines the cluster of characters to use in optical character recognition (column 7, lines 15-21 of Chino).

Regarding claims 23 and 100: Sugiyama does not disclose expressly that the multimedia function includes applying a motion analysis function to the time-based media data.

Art Unit: 2624

Chino discloses applying a motion analysis function to time-based media data (figure 3(102f) and column 7, lines 33-38 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a motion analysis function to time-based media data, as taught by Chino. The suggestion for doing so would have been that detection of a user's motion and gestures is simply another useful electronic means to input data into a computerized system (figure 3 and column 7, lines 2-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 23 and 100.

Regarding claim 35: Sugiyama discloses that the multimedia function includes applying a visual inspection function to the time-based media data (column 5, lines 56-65 of Sugiyama).

Regarding claim 42: Sugiyama does not disclose expressly that said user interface is configured to allow a user to control audio sound localization hardware.

Chino discloses controlling audio sound localization hardware (column 13, lines 5-14 of Chino). By using the gaze object detection portion of the multi-modal interface apparatus, the audio sound localization is determined.

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to configure said user interface to allow a user to control audio sound localization hardware, as taught by Chino. The motivation

Art Unit: 2624

for doing so would have been to ensure that user input is intended, and the user is not speaking to someone else (column 1, lines 52-58 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claim 42.

Regarding claim 43: Sugiyama does not disclose expressly that said user interface is configured to allow a user to control motion detection hardware.

Chino discloses controlling motion detection hardware (figure 3(102f) and column 7, lines 33-38 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to configure said user interface to allow a user to control motion detection hardware, as taught by Chino. The suggestion for doing so would have been that detection of a user's motion and gestures is simply another useful electronic means to input data into a computerized system (figure 3 and column 7, lines 2-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claim 43.

Regarding claim 50: Sugiyama discloses that the processor is further configured to display results of the multimedia function on the display of the user interface (column 4, lines 30-35 of Sugiyama).

Regarding claim 62: Sugiyama does not disclose expressly that the second output device is audio sound localization hardware.

Chino discloses controlling as an output device audio sound localization hardware (column 13, lines 5-14 of Chino). By

Art Unit: 2624

using the gaze object detection portion of the multi-modal interface apparatus, the audio sound localization is determined.

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to output audio data through audio sound localization hardware, as taught by Chino. The motivation for doing so would have been to ensure that user input is intended, and the user is not speaking to someone else (column 1, lines 52-58 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claim 62.

Regarding claim 74: Sugiyama does not disclose expressly that the second output device is hardware for capturing data from an electronic pen.

Chino discloses controlling as an output device hardware for capturing data from an electronic pen (figure 3(102i) and column 7, lines 14-16 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of digital data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use hardware for capturing data from an electronic pen, as taught by Chino. The suggestion for doing so would have been that an electronic pen is simply another useful output device that provides digital data a user may wish to obtain (figure 3 and column 6, lines 66-67 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claim 74.

Art Unit: 2624

7. Claims 5-6 and 82-83 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888) and Kametani (US Patent 5,091,948).

Regarding claims 5 and 82: Sugiyama in view of Chino does not disclose expressly that said multimedia function includes applying a speaker segmentation function to the time-based media data.

Kametani discloses applying a speaker segmentation function to time-based media data (figure 3d and column 5, lines 5-9 and lines 29-33 of Kametani).

Sugiyama in view of Chino is combinable with Kametani because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a speaker segmentation function to said time-based media data, as taught by Kametani. The motivation for doing so would have been that using a speaker segmentation function extracts parameters that uniquely identify a speaker, thus improving the level of speaker discrimination (column 5, lines 29-35 of Kametani). Therefore, it would have been obvious to combine Kametani with Sugiyama in view of Chino to obtain the invention as specified in claims 5, 13, 82 and 90.

Further regarding claims 6/1, 6/5, and 83/78, 83/82:

Kametani discloses applying a speaker recognition function to said time-based media data (column 5, lines 29-35 of Kametani).

8. Claims 9-11, 14, 86-88 and 91 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723)

Art Unit: 2624

in view of Chino (US Patent 6,118,888) and Halverson (US Patent Application Publication 2002/0101513 A1).

Regarding claims 9 and 86: Sugiyama in view of Chino does not disclose expressly that said multimedia function includes applying a speech recognition function to said time-based media data.

Halverson discloses applying a speech recognition function to time-based media data (para. 24, lines 2-5 and para. 25, lines 21-23 of Halverson).

Sugiyama in view of Chino is combinable with Halverson because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a speech recognition function, as taught by Halverson. The motivation for doing so would have been that speech is a useful and natural form of human input (para. 25, lines 11-14 of Halverson). Therefore, it would have been obvious to combine Halverson with Sugiyama in view of Chino to obtain the invention as specified in claims 9 and 86.

Further regarding claims 10 and 87: Halverson discloses applying a profile analysis function to the time-based media data (para. 23, lines 4-7 of Halverson).

Regarding claims 11 and 88: Sugiyama does not disclose expressly that said multimedia function includes applying audio event detection to the time-based media data.

Chino discloses applying audio event detection to the time-based media data (column 14, lines 8-18 of Chino). The system detects when audio data is intended to be input by the user,

Art Unit: 2624

while any other noise is ignored by the system (column 14, lines 8-18 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to detect audio data events, as taught by Chino. The motivation for doing so would have been to prevent unintended and erroneous audio input (column 14, lines 10-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 11 and 88.

Regarding claims 14 and 91: Sugiyama does not disclose expressly that said multimedia function includes applying a sound source localization function to the time-based media data.

Chino discloses applying a sound source localization function to time-based media data (column 13, lines 5-14 of Chino). By using the gaze object detection portion of the multi-modal interface apparatus, the audio sound source localization is determined.

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to configure the user interface to apply a sound source localization function to the time-based media data, as taught by Chino. The motivation for doing so would have been to ensure that user input is intended, and the user is not speaking to someone else (column 1, lines 52-58 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 14 and 91.

Art Unit: 2624

9. Claims 12-13 and 89-90 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888), Halverson (US Patent Application Publication 2002/0101513 A1) and Kametani (US Patent 5,091,948).

Regarding claims 12 and 89: Sugiyama in view of Chino and Halverson does not disclose expressly that said multimedia function includes applying a speaker recognition function to said time-based media data.

Kametani discloses applying a speaker recognition function to said time-based media data (column 5, lines 29-35 of Kametani).

Sugiyama in view of Chino and Halverson is combinable with Kametani because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a speaker recognition function to said time-based media data, as taught by Kametani. The motivation for doing so would have been that using a speaker recognition function extracts parameters that uniquely identify a speaker, thus improving the level of speaker discrimination (column 5, lines 29-35 of Kametani). Therefore, it would have been obvious to combine Kametani with Sugiyama in view of Chino and Halverson to obtain the invention as specified in claims 12 and 89.

Regarding claims 13 and 90: Sugiyama in view of Chino and Halverson does not disclose expressly that said multimedia function includes applying a speaker segmentation function to the time-based media data.

Art Unit: 2624

Kametani discloses applying a speaker segmentation function to time-based media data (figure 3d and column 5, lines 5-9 and lines 29-33 of Kametani).

Sugiyama in view of Chino and Halverson is combinable with Kametani because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a speaker segmentation function to said time-based media data, as taught by Kametani. The motivation for doing so would have been that using a speaker segmentation function extracts parameters that uniquely identify a speaker, thus improving the level of speaker discrimination (column 5, lines 29-35 of Kametani). Therefore, it would have been obvious to combine Kametani with Sugiyama in view of Chino and Halverson to obtain the invention as specified in claims 13 and 90.

10. Claims 17, 76 and 94 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888) and Krumm (US Patent 6,611,622 B1).

Regarding claims 17 and 94: Sugiyama in view of Chino does not disclose expressly that said multimedia function includes applying a color histogram analysis function to said time-based media data.

Krumm discloses applying a color histogram analysis function to time-based media data (figure 2(202) and column 8, lines 46-47 of Krumm).

Sugiyama in view of Chino is combinable with Krumm because they are from the same field of endeavor, namely control and

Art Unit: 2624

processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a color histogram analysis function to the time-based media data, as taught by Krumm. The motivation for doing so would have been to better identify people or objects in scenes generated subsequent to a model scene (column 8, lines 53-58 of Krumm). Therefore, it would have been obvious to combine Krumm with Sugiyama in view of Chino to obtain the invention as specified in claims 17 and 94.

Regarding claim 76: Sugiyama in view of Chino does not disclose expressly that the second output device is a flash memory device.

Krumm discloses outputting computer data to a flash memory device (column 7, lines 27-33 of Krumm).

Sugiyama in view of Chino is combinable with Krumm because they are from the same field of endeavor, namely control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to have the second output device be the flash memory device taught by Krumm. The suggestion for doing so would have been that a flash memory device is one of many possible useful output devices available to those of ordinary skill in the art (column 7, lines 27-36 of Krumm). Therefore, it would have been obvious to combine Krumm with Sugiyama in view of Chino to obtain the invention as specified in claim 76.

11. Claims 24/1, 24/23 and 101/100 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888) and Kim (US Patent 6,594,377 B1).

Art Unit: 2624

Regarding claims 24/1, 24/23, and 101/100: Sugiyama in view of Chino does not disclose expressly that said multimedia function includes a distance estimation function to the time-based media data.

Kim discloses applying a distance estimation to image media data (column 3, lines 33-36 of Kim).

Sugiyama in view of Chino is combinable with Kim because they are from the same field of endeavor, namely the control and processing of media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply distance estimation, as taught by Kim, to the time-based media data. The motivation for doing so would have been to determine if the user, or a relevant part of the user, is within the required operational range (column 4, lines 28-34 of Kim). Therefore, it would have been obvious to combine Kim with Sugiyama in view of Chino to obtain the invention as specified in claims 24/1, 24/23 and 101/100.

12. Claim 101/78 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Kim (US Patent 6,594,377 B1).

Regarding claim 101/78: Sugiyama does not disclose expressly that said multimedia function includes a distance estimation function to the time-based media data.

Kim discloses applying a distance estimation to image media data (column 3, lines 33-36 of Kim).

Sugiyama and Kim are combinable because they are from the same field of endeavor, namely the control and processing of media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply

Art Unit: 2624

distance estimation, as taught by Kim, to the time-based media data. The motivation for doing so would have been to determine if the user, or a relevant part of the user, is within the required operational range (column 4, lines 28-34 of Kim). Therefore, it would have been obvious to combine Kim with Sugiyama to obtain the invention as specified in claim 101/78.

13. Claims 25-31 and 102-108 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888) and Krumm (US Patent 6,611,622 B1).

Regarding claims 25 and 102: Sugiyama in view of Chino does not disclose expressly that said multimedia function includes applying a foreground/background segmentation function to said time-based media data.

Krumm discloses applying a foreground/background segmentation function to time-based media data (column 10, lines 13-15 of Krumm).

Sugiyama in view of Chino is combinable with Krumm because they are from the same field of endeavor, namely control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a foreground/background segmentation function to the time-based media data, as taught by Krumm. The motivation for doing so would have been that the foreground segment is needed to further segment for the purpose of identifying people and objects in an image (column 10, lines 15-18 of Krumm). Therefore, it would have been obvious to combine Krumm with Sugiyama in view of Chino to obtain the invention as specified in claims 25 and 102.

Regarding claims 26 and 103: Sugiyama in view of Chino does not disclose expressly that said multimedia function includes applying a scene segmentation function to said time-based media data.

Krumm discloses applying a scene segmentation function to time-based media data (column 10, lines 15-18 of Krumm).

Sugiyama in view of Chino is combinable with Krumm because they are from the same field of endeavor, namely control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a scene segmentation function to the time-based media data, as taught by Krumm. The motivation for doing so would have been that segmenting the foreground scene is needed to identify people and objects in an image (column 10, lines 15-18 of Krumm). Therefore, it would have been obvious to combine Krumm with Sugiyama in view of Chino to obtain the invention as specified in claims 26 and 103.

Regarding claims 27 and 104: Sugiyama does not disclose expressly that said multimedia function includes applying a face recognition function to the time-based media data.

Chino discloses applying a face recognition function to time-based media data (figure 20(406) and column 24, lines 25-27 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a face recognition function to time-based media data, as taught by Chino. The motivation for doing so would have been to determine which particular user corresponds to the current user

Art Unit: 2624

by recognition of the current user's face (column 26, lines 20-22 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 27 and 104.

Regarding claims 28 and 105: Sugiyama does not disclose expressly that said multimedia function includes applying a face detection function to the time-based media data.

Chino discloses applying a face detection function to time-based media data (figure 20(406) and column 24, lines 25-27 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a face detection function to time-based media data, as taught by Chino. The motivation for doing so would have been to determine which particular user corresponds to the current user by recognition of the current user's face (column 26, lines 20-22 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 28 and 105.

Regarding claims 29 and 106: Sugiyama does not disclose expressly that the multimedia function includes applying an optical character recognition function to the time-based media data.

Chino discloses applying an optical character recognition function to time-based media data (figure 3(102j) and column 7, lines 14-18 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of

Art Unit: 2624

time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply an optical character recognition function to time-based media data, as taught by Chino. The suggestion for doing so would have been that character recognition from an electronic pen is simply another useful electronic means to input data into a computerized system (figure 3 and column 7, lines 2-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 29 and 106.

Regarding claims 30 and 107: Sugiyama does not disclose expressly that said multimedia function includes applying a face recognition function to the time-based media data.

Chino discloses applying a face recognition function to time-based media data (figure 20(406) and column 24, lines 25-27 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a face recognition function to time-based media data, as taught by Chino. The motivation for doing so would have been to determine which particular user corresponds to the current user by recognition of the current user's face (column 26, lines 20-22 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 30 and 107.

Regarding claims 31 and 108: Sugiyama does not disclose expressly that said multimedia function includes applying a face detection function to the time-based media data.

Chino discloses applying a face detection function to time-based media data (figure 20(406) and column 24, lines 25-27 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a face detection function to time-based media data, as taught by Chino. The motivation for doing so would have been to determine which particular user corresponds to the current user by recognition of the current user's face (column 26, lines 20-22 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 31 and 108.

14. Claims 32-34 and 109-111 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888) and Gerber (US Patent 5,568,406).

Regarding claims 32 and 109: Sugiyama in view of Chino does not disclose expressly that said multimedia function includes applying an automobile recognition function to said time-based media data.

Gerber discloses applying an automobile recognition function to time-based media data (column 8, lines 42-45 of Gerber).

Sugiyama in view of Chino is combinable with Gerber because they are from the same field of endeavor, namely the control and processing of time-based image data. At the time of the invention, it would have been obvious to a person of ordinary

Art Unit: 2624

skill in the art to apply an automobile recognition function to said time-based media data, as taught by Gerber. The motivation for doing so would have been to determine from the time-based media data whether or not the automobile in the time-based media data is stolen (column 8, lines 45-46 of Gerber). Therefore, it would have been obvious to combine Gerber with Sugiyama in view of Chino to obtain the invention as specified in claims 32 and 109.

Regarding claims 33 and 110: Sugiyama does not disclose expressly that the multimedia function includes applying a motion analysis function to the time-based media data.

Chino discloses applying a motion analysis function to time-based media data (figure 3(102f) and column 7, lines 33-38 of Chino).

Sugiyama and Chino are combinable because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a motion analysis function to time-based media data, as taught by Chino. The suggestion for doing so would have been that detection of a user's motion and gestures is simply another useful electronic means to input data into a computerized system (figure 3 and column 7, lines 2-11 of Chino). Therefore, it would have been obvious to combine Chino with Sugiyama to obtain the invention as specified in claims 33 and 110.

Regarding claims 34 and 111: Sugiyama in view of Chino does not disclose expressly that said multimedia function includes applying a license plate recognition function to said time-based media data.

Art Unit: 2624

Gerber discloses applying a license plate recognition function to time-based media data (column 3, lines 42-47 and lines 63-64 of Gerber).

Sugiyama in view of Chino is combinable with Gerber because they are from the same field of endeavor, namely the control and processing of time-based image data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply a license plate recognition function to said time-based media data, as taught by Gerber. The motivation for doing so would have been to determine from the time-based media data whether or not the automobile in the time-based media data is stolen (column 1, line 66 to column 2, line 2 of Gerber). Therefore, it would have been obvious to combine Gerber with Sugiyama in view of Chino to obtain the invention as specified in claims 34 and 111.

15. Claims 36-39, 44-45, 47, 51-58, 63, 65, 73 and 75 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888) and Hymel (US Patent Application Publication 2003/0220988 A1).

Regarding claims 36-39, 44-45 and 47: Sugiyama in view of Chino does not disclose expressly that said user interface is configured to allow a user to control a compact disc (CD) device, a digital video disc (DVD) device, an audio tape device, a video tape device, a MIDI player, a cellular telephone, and/or a world wide web display.

Hymel discloses a user interface configured to allow a user to control (para. 10, lines 1-5 of Hymel) a compact disc (CD) device (para. 10, lines 14-15 and lines 19-20 of Hymel), a

Art Unit: 2624

digital video disc (DVD) device (para. 10, lines 14-15 and lines 20-21 of Hymel), an audio tape device (audio tape device is a type of audio player, MP3 player is merely an example) (para. 10, lines 14-15 and line 19 of Hymel), a video tape device (digital camcorder, which, as is well-known in the art, uses a digital video (DV) cassette tape) (para. 10, lines 14-15 and line 20 of Hymel), a MIDI player (MIDI player is a type of audio player, MP3 player is merely an example) (para. 10, lines 14-15 and line 19 of Hymel), a cellular telephone (para. 10, lines 14-15 of Hymel), and/or a world wide web display (figure 1(130) and para. 11, lines 1-10 of Hymel).

Sugiyama in view of Chino is combinable with Hymel because they are from similar problem solving areas, namely the control of data storage and output. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to configure said user interface so that the user interface allows a user to control a compact disc (CD) device, a digital video disc (DVD) device, an audio tape device, a video tape device, a MIDI player, a cellular telephone, and/or a world wide web display, as taught by Hymel. The motivation for doing so would have been to allow a user to connect a variety of different types of peripheral devices to an overall system, thus allowing the user to perform a variety of functions (para. 2, lines 1-6 of Hymel). Therefore, it would have been obvious to combine Hymel with Sugiyama in view of Chino to obtain the invention as specified in claims 36-39, 44-45 and 47.

Regarding claims 51-58, 63, 65, 73 and 75: Sugiyama in view of Chino does not disclose expressly that the second output device is a DVD drive, CD drive, audio tape drive, video cassette device, removable media device, embedded audio

Art Unit: 2624

recorder, embedded video recorder, non-volatile storage device, cellular telephone, world-wide web display, hardware for performing audio capture, and/or a disposable media writer.

Hymel discloses a user interface configured to allow a user to control as an output device (para. 10, lines 1-5 of Hymel) a DVD drive (para. 10, lines 14-15 and lines 20-21 of Hymel), CD drive (para. 10, lines 14-15 and lines 19-20 of Hymel), audio tape drive (audio tape drive is a type of audio player, MP3 player is merely an example) (para. 10, lines 14-15 and line 19 of Hymel), video cassette device (digital camcorder, which, as is well-known in the art, uses a digital video (DV) cassette tape) (para. 10, lines 14-15 and line 20 of Hymel), removable media device (the compact discs used in compact disc devices are well-known to be removable media devices) (para. 10, lines 14-15 and lines 19-20 of Hymel), embedded (para. 10, lines 22-26 of Hymel) audio recorder (para. 10, lines 14-15 and line 19 of Hymel), embedded (para. 10, lines 22-26 of Hymel) video recorder (para. 10, lines 14-15 and line 20 of Hymel), non-volatile storage device (compact disc devices and digital video disc devices are well-known to be non-volatile storage media devices) (para. 10, lines 14-15 and lines 19-21 of Hymel), cellular telephone (para. 10, lines 14-15 of Hymel), world-wide web display (figure 1 (130) and para. 11, lines 1-10 of Hymel), hardware for performing audio capture (as is well-known in the art, part of the function of a digital camcorder is to capture audio signals, along with the video) (para. 10, lines 14-15 and line 20 of Hymel), and/or a disposable media writer (compact discs (CD-R's) and digital video discs (DVD±R's) are well-known to be disposable media) (para. 10, lines 14-15 and lines 19-21 of Hymel).

Art Unit: 2624

Sugiyama in view of Chino is combinable with Hymel because they are from similar problem solving areas, namely the control of data storage and output. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to have the second output device be a DVD drive, CD drive, audio tape drive, video cassette device, removable media device, embedded audio recorder, embedded video recorder, non-volatile storage device, cellular telephone, world-wide web display, hardware for performing audio capture, and/or a disposable media writer, as taught by Hymel. The motivation for doing so would have been to allow a user to connect a variety of different types of peripheral devices to an overall system, thus allowing the user to perform a variety of functions (para. 2, lines 1-6 of Hymel). Therefore, it would have been obvious to combine Hymel with Sugiyama in view of Chino to obtain the invention as specified in claims 51-58, 63, 65, 73 and 75.

16. Claims 40-41, 49, 59-61, 69 and 77 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888) and Stevens (US Patent Application Publication 2002/0010641 A1).

Regarding claims 40-41 and 49: Sugiyama in view of Chino does not disclose expressly that said user interface is configured to allow a user to control a multimedia server, encryption hardware, and/or a radio receiver.

Stevens discloses a user interface (figure 3(104) of Stevens) configured to allow a user to control a multimedia server (para. 53, lines 6-10 of Stevens), encryption hardware (para. 54, lines 1-9 of Stevens), and a radio receiver (figure 3(110) and para. 36, lines 1-8 of Stevens).

Art Unit: 2624

Sugiyama in view of Chino is combinable with Stevens because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to configure said user interface to allow a user to control encryption hardware and a radio receiver, as taught by Stevens. The motivation for doing so would have been to allow users to retrieve desired distributions of audio and video data over a controlled broadcast (para. 4, lines 1-5 of Stevens). Therefore, it would have been obvious to combine Stevens with Sugiyama in view of Chino to obtain the invention as specified in claims 40-41 and 49.

Regarding claims 59-61, 69 and 77: Sugiyama in view of Chino does not disclose expressly that the second output device is an embedded multimedia server, audio encryption hardware, video encryption hardware, a satellite radio receiver and/or a wireless device.

Stevens discloses controlling as an output device an embedded multimedia server (para. 53, lines 6-10 of Stevens), audio encryption hardware (para. 54, lines 1-4 and para. 57, lines 3-4 of Stevens), video encryption hardware (para. 54, lines 1-4 of Stevens), a satellite radio receiver (para. 36, lines 1-6 of Stevens), and/or a wireless device (para. 36, lines 1-6 of Stevens). As is well-known in the art, a satellite radio receiver is a type of wireless device.

Sugiyama in view of Chino is combinable with Stevens because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to have the second output device be an

Art Unit: 2624

embedded multimedia server, audio encryption hardware, video encryption hardware, and/or a satellite radio receiver, as taught by Stevens. The motivation for doing so would have been to allow users to retrieve desired distributions of audio and video data over a controlled broadcast (para. 4, lines 1-5 of Stevens). Therefore, it would have been obvious to combine Stevens with Sugiyama in view of Chino to obtain the invention as specified in claims 59-61, 69 and 77.

17. Claims 46, 64, 66-68 and 71 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888), Stevens (US Patent Application Publication 2002/0010641 A1), and McCarthy (US Patent 6,296,693 B1).

Regarding claim 46: Sugiyama in view of Chino does not disclose expressly that said user interface is configured to allow a user to control a two-way radio.

Stevens discloses a user interface (figure 3(104) of Stevens) configured to allow a user to control a radio receiver (figure 3(110) and para. 36, lines 1-8 of Stevens).

Sugiyama in view of Chino is combinable with Stevens because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to configure said user interface to allow a user to control a radio receiver, as taught by Stevens. The motivation for doing so would have been to allow users to retrieve desired distributions of audio and video data over a controlled broadcast (para. 4, lines 1-5 of Stevens).

Art Unit: 2624

Therefore, it would have been obvious to combine Stevens with Sugiyama in view of Chino.

Sugiyama in view of Chino and Stevens does not disclose expressly that said radio is specifically a two-way radio.

McCarthy discloses using a two-way (CB) radio (column 7, lines 13-16 and lines 21-23 of McCarthy).

Sugiyama in view of Chino and Stevens is combinable with McCarthy because they are from similar problem solving areas, namely the control of data communication hardware. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to provide for user control of a radio, as taught by Stevens, wherein said radio is specifically a two-way radio, as taught by McCarthy. The motivation for doing so would have been to provide the user with means of personal communication. Therefore, it would have been obvious to combine McCarthy with Sugiyama in view of Chino and Stevens to obtain the invention as specified in claim 46.

Regarding claims 64, 66-68 and 71: Sugiyama in view of Chino does not disclose expressly that the second output device is a two-way radio, a radio receiver for receiving AM signals, a radio receiver for receiving FM signals, a radio receiver for receiving short wave radio signals, and/or an emergency alert monitor for receiving emergency broadcast system alerts.

Stevens discloses controlling as an output device a radio receiver (para. 36, lines 1-6 of Stevens).

Sugiyama in view of Chino is combinable with Stevens because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to have the second output device be a

Art Unit: 2624

radio receiver, as taught by Stevens. The motivation for doing so would have been to allow users to retrieve desired distributions of audio data over a controlled broadcast (para. 4, lines 1-5 of Stevens). Therefore, it would have been obvious to combine Stevens with Sugiyama in view of Chino.

Sugiyama in view of Chino and Stevens does not disclose expressly that said radio receiver is a two-way radio, a radio receiver for receiving AM signals, a radio receiver for receiving FM signals, a radio receiver for receiving short wave radio signals, and/or an emergency alert monitor for receiving emergency broadcast system alerts.

McCarthy discloses output devices including a two-way (CB) radio (column 7, lines 13-16 and lines 21-23 of McCarthy), a radio receiver for receiving AM signals (column 7, lines 13-16 and lines 20-21 of McCarthy), a radio receiver for receiving FM signals (column 7, lines 13-16 and lines 20-21 of McCarthy), a radio receiver for receiving short wave radio signals (column 7, lines 13-16 and lines 21-23 of McCarthy), and/or an emergency alert monitor for receiving emergency broadcast system alerts (column 7, lines 13-16 and lines 18-20 of McCarthy).

Sugiyama in view of Chino and Stevens is combinable with McCarthy because they are from similar problem solving areas, namely the control of data communication hardware. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to provide for user control of a radio, as taught by Stevens, wherein said radio is specifically a two-way radio, a radio receiver for receiving AM signals, a radio receiver for receiving FM signals, a radio receiver for receiving short wave radio signals, and/or an emergency alert monitor for receiving emergency broadcast system alerts, as

Art Unit: 2624

taught by McCarthy. The motivation for doing so would have been to provide the user with means of personal communication. Therefore, it would have been obvious to combine McCarthy with Sugiyama in view of Chino and Stevens to obtain the invention as specified in claims 64, 66-68 and 71.

18. Claim 48 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888) and Wedekind (US Patent 5,115,967).

Regarding claim 48: Sugiyama in view of Chino does not disclose expressly that said user interface is configured to allow a user to control a climate sensor.

Wedekind discloses computer control (column 4, lines 53-58 of Wedekind) of a climate sensor (column 5, lines 3-9 of Wedekind).

Sugiyama in view of Chino is combinable with Wedekind because they are from the same field of endeavor, namely the control and processing of time-based data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to configure said user interface to allow a user to control a climate sensor, as taught by Wedekind. The motivation for doing so would have been to control the overall climate of the room or building in which the printer system user is located. Therefore, it would have been obvious to combine Wedekind with Sugiyama in view of Chino to obtain the invention as specified in claim 48.

19. Claim 70 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of

Art Unit: 2624

Chino (US Patent 6,118,888) and Rowe (US Patent Application Publication 2001/0003846 A1).

Regarding claim 70: Sugiyama in view of Chino does not disclose expressly that the second output device is a weather alert receiver.

Rowe discloses controlling as an output device a weather alert receiver (para. 62, lines 3-6 of Rowe).

Sugiyama in view of Chino is combinable with Rowe because they are from the same field of endeavor, namely the control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use a weather alert receiver as an output device, as taught by Rowe. The suggestion for doing so would have been that weather alert data is simply another form of useful multi-media data that a user may wish to obtain. Therefore, it would have been obvious to combine Rowe with Sugiyama in view of Chino to obtain the invention as specified in claim 70.

20. Claim 72 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sugiyama (US Patent 5,633,723) in view of Chino (US Patent 6,118,888) and Abgrall (US Patent 6,373,498 B1).

Regarding claim 72: Sugiyama in view of Chino does not disclose expressly that the second output device is a weather alert receiver.

Abgrall discloses controlling as an output device hardware for performing VGA screen captures (column 12, lines 6-8 of Abgrall).

Sugiyama in view of Chino is combinable with Abgrall because they are from the same field of endeavor, namely the

Art Unit: 2624

control and processing of time-based media data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use hardware to perform VGA screen captures, as taught by Abgrall. The suggestion for doing so would have been that a VGA screen capture is simply another form of useful multi-media data that a user may wish to obtain. Therefore, it would have been obvious to combine Abgrall with Sugiyama in view of Chino to obtain the invention as specified in claim 72.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to James A. Thompson whose telephone number is 571-272-7441. The examiner can normally be reached on 8:30AM-5:00PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David K. Moore can be reached on 571-272-7437. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
